## 1 - Introduction

With data breaches all over the news, small and midsize businesses need to manage their exposure to the financial risk that accompanies cyber threats. Data breaches come in many shapes and sizes. The average person hears "data breach" and probably thinks of hackers. But there are many kinds of cyber incidents, and most don't come from malware or ransomware. Instead they are the result of insider data breaches, data theft by employees, and employee mistakes.

Most business owners understand that personally identifiable customer information they have on their computers is a target for hackers and that their online presence leaves them open to liability. However, far fewer take adequate measures to protect their business.

To mitigate the risk of civil litigation and other penalties when a data loss or theft occurs, our cyber liability and data breach report is designed to expose just how vulnerable your organization may be. The report not only identifies specific and detailed instances of personal identifiable information (PII) throughout your computer network that could be the target of hackers and malicious insiders but also calculates and quantifies the potential monetary liability. Additionally, the security of the computer is also examined to quantify the probability of a breach.
